Trust Wallet – Product Marketing Manager

Dear Trust Wallet team,

Finding the trust proof a company already has, and putting it where buyers ask the question, is work I've already done. I found one such gap on Trust Wallet's site.

Your security page exists to tell people whether they can trust Trust Wallet with their money. It leans on audit firms, ISO certifications and a bug bounty program, and those are strong credentials. The page leaves out its most direct proof.

After the browser extension security incident in December 2025, Binance, which acquired Trust Wallet in 2018, publicly committed $7 million to reimburse affected users in full. Binance's founder confirmed it publicly. Today that story, and the SAFU fund (Binance's Secure Asset Fund for Users) behind it, sit only in incident-response posts.

Banks show their deposit protection where customers decide whether to trust them. The reimbursement is Trust Wallet's nearest equivalent: proof that users get paid back when something goes wrong. It belongs on the page people open when they are deciding whether to trust the wallet.

At Reform, a form and onboarding platform, I repositioned the product for buyers who had no fixed picture of the category, and trial activation rose 34%. Many people opening a self-custody wallet for the first time start from the same place.

At FunnelEnvy, I built attribution across brands because single-channel reports kept overstating each channel's share of pipeline. Here I'd measure whether the reimbursement story changes what visitors to the security page do next, such as installing the wallet or contacting support.

I know this audience as a user. I was an active retail crypto investor in 2021, and I published a search and AI answer teardown of Binance across six African markets and four languages.

I put together a short teardown of the security page gap and where I'd place the fix.

James

P.S. I've created a portfolio focused on this role at jamespraise.xyz/work/trust-wallet.
