

Taptap Send – Nigeria Corridor Growth & Product Marketing

I'm writing about a role Taptap Send doesn't have open: someone who owns how Nigerian senders find and compare transfer apps, through search, AI answers and the corridor's own content. I've done this work before, and I live in Lagos.

People already look for Taptap by name. Brand searches beat LemFi's in the UK (14,800 a month against 12,100) and in the US (22,200 against 8,100). But on 5 October I ran 26 Nigerian sender searches from the UK, US and Canada, and taptapsend.com made Google's top 20 in one. For "send money to nigeria" in the UK, Google's AI Overview named Western Union, LemFi, Wise, Revolut and Remitly and cited each one's Nigeria page. "Pound to naira" and "dollar to naira" bring about 55,000 searches a month between them, and Wise, Sendwave and WorldRemit answer them with rate pages. The one search where Taptap ranked, "best app to send money to nigeria" in the UK, is also the one where the AI Overview cited its Nigeria page.

I documented the same pattern for Binance across six African markets. Where a plain local page exists, AI answers use it, and where it doesn't, the answer goes to whoever wrote one. At [Reform](#), an AI-assisted SEO engine I built lifted non-branded organic traffic 48%. At [Distrobird](#), my team of five writers ranked for 3,000+ competitive keywords in three months. I also run search for my own Nigerian health site, where the first audit found Google didn't know 34 of its 60 pages.

I'd start with Nigeria pages for UK and US senders, a naira rate hub and a plain page on rate versus fee, then the card and savings story for Nigerian senders. This sits beside the General Manager, central growth and performance roles you're hiring for, and gives each of them organic installs and rate-page visitors to work with.

I'd like to walk you through the full search check and talk about whether this belongs beside the Nigeria team.
