Framer – GTM Engineer

Framer's GTM Engineer role asks for a signal system built from scratch, and I've built one. For my own go-to-market business, I wrote a prospect data pipeline in Python that pulls from 10+ sources, including SEC funding filings, Clutch, GitHub and app stores, into one schema with deduplication, enrichment, signal scoring and my own email verifier. One live run sourced 409 companies and produced 267 send-ready leads.

I also own integration work when the tools underneath a team change. At Reform, I led the email platform migration from Userlist to Brevo, set up authentication, cleaned the list and validated the n8n workflows before cutover.

I haven't used Pocus or Gong. Every source I've added to that pipeline came with its own data structure, and I've learned to wire each new one in quickly.

Framer's strongest edge is site performance. A company that just raised a round while still running a slow site on another platform is the first signal I'd want your sales team to see.

James

P.S. I've created a portfolio focused on this role at https://jamespraise.xyz/work/framer/.
