Trust Wallet – Product Marketing Manager

I'm reaching out as someone who has spent the last several years building exactly the kind of product marketing systems a self-custody product needs to earn trust at scale.

My name is James. I'm a product marketing operator with 7+ years of hands-on experience across B2B, SaaS, and consumer-facing companies in Africa, North America, and Europe, moving fluidly across brand, growth, and product marketing rather than owning a single channel. I founded and grew Marketing In Action from zero into a 5,000+ subscriber community and media platform, real community ownership, not just campaign reach.

I want to name something specific I found while researching Trust Wallet. The `/security` page, the one page built to answer "can I trust this with my money," leans entirely on audit firms, ISO certifications, and a bug bounty program. That's a genuinely strong credential stack. But it doesn't mention the SAFU fund, the December 2025 extension incident, or the fact that Binance publicly committed to, and is executing, full reimbursement, a real, named, quantified trust asset ($7M committed, founder-level public confirmation) sitting only in reactive incident-response content instead of on the page built for exactly this question. A fintech would make deposit insurance permanent homepage furniture. Trust Wallet has the crypto equivalent of that proof and isn't using it as standing trust infrastructure yet.

That's the kind of gap I've spent my career closing: noticing which proof a company already has and isn't surfacing where the buyer is asking the question, instead of inventing a new campaign. At Reform, that meant repositioning a product for an audience with no fixed mental model of the category, 34% lift in trial activation. At FunnelEnvy, I built a cross-brand attribution stack specifically because single-channel reporting kept overstating each channel's real contribution to pipeline, the same instinct that would apply to checking whether the SAFU story is resonating once it's live, not just assuming it will.

I know this audience from the inside. I was an active retail crypto investor in 2021, and I published a search and AI answer teardown of Binance across 6 African markets and 4 languages. The same discipline applies here: translating a technical trust story into language a worried user reads in the moment they're asking "is my money safe here."

I put together a short teardown of the security-page gap and where I'd place the fix.

Thank you for taking the time to read this.

James

P.S. I've created a portfolio focused on this role at jamespraise.xyz/work/trust-wallet.
